

Easy Email Notification Without PC

Before

Did not know about issues at the site so responses were delayed, productivity began to drop, and conditions became very serious.

The problem became even more apparent with the increase in remote work.

After

Response speed has improved by receiving information about onsite troubles by email.

Conditions at the site can be promptly dealt with even while working remotely.

Method

Contact signal input is captured by the NBM unit and email notification is transmitted to a PC or mobile phone via the network.

Trigger conditions and email delivery contents can be registered with the NBM's web browser.

Model

Model: NBM-D88N
